

How hot's your pile?

REOTEMP Compost Instruments

Moisture Meter

- Easy to operate
- Power source: one AA battery
- Easy to calibrate for any compost or soil type
- 0-10 scale

The REOTEMP® Moisture Meter is a self-calibrated instrument. The meter indicates the moisture content of your compost pile or soil sample by means of a sensor at the bottom of the probe. The probe is sensitive only at the tip. Calibrate the instrument by inserting the tip into an ideal sample of compost or soil and adjusting the needle to a “5” on the 0 to 10 scale. Then, the next time you insert your Moisture meter you’ll know relative to your ideal moisture content whether your soil is too dry or too wet. The meter is sensitive to changing salt content and can be used to track leachate. Used by composters, farmers, and nurseries across country.

To Order:

Ask for model MM and specify length.
